

Effect of the Fluctuations of Heat on Growth, Fruiting and Yield of Some Plum Cultivars under Kalubia Governorate

Fathi, M.A., El-Naggar, Y.I., Taha, Nevein, M. and Darwish, R.D.

Deciduous Fruits Research Department, Horticulture, research Institute, Agric. Res. Center, Giza, Egypt.

ABSTRACT

This study was carried out on three Japanese plum cultivars (*Prunus salicina* L.), namely Hollywood, Pionear and Aspani, grafted on Marianna plum rootstock (P. cerasifera). Six-yearold trees planted at 4 × 4 m spacing (260 trees/Fed.) under flood irrigation at El-Kanater Research Station, Egypt, were sprayed on 23 January, 1 February, or 15 February during the 2022/2023 and 2023/2024 seasons with 0.5, 1.0, or 1.5% hydrogen cyanamide (Dormex, H₂CN₂) combined with 3% summer oil (Caple 2). Hollywood trees exhibited the earliest flowering (18– 22 February), fruit set (15–16 March), and harvest (1–18 May), along with the shortest flowering and fruiting durations. Hollywood fruits also showed higher TSS and TSS/acidity ratio, lower acidity, and greater fruit number, firmness, and net income in the first season. Pionear produced the highest yield, better flowering overlap with the other cultivars, and superior fruit number, firmness, weight, size, and economic return during the second season. Aspani recorded higher fruit set percentage and larger fruits in one season. Overall, the results indicate that Hollywood and Pionear cultivars perform most favorably under the tested conditions. It is recommended to spray these cultivars with 1.5% Dormex + 3% Caple 2 on 15 February when trees accumulate approximately 74–109 °C \le 7.2 °C and 326–393 h \le 10 °C to achieve earlier flowering, improved fruit set, higher yield and quality, and greater economic returns.

Keywords: Plum Cultivars- Hallywood- Pionear- Aspani Flood Irrigation- Breaking Agent.

INTRODUCTION

Many plum cultivars produce sweet fruits especially in newly reclaimed areas. According to FAO (2016) the area cultivated with plum in Egypt is 6085 Fed., in which produced about 42550 tons per year. Japanese plum is considered the main group being grown in Egypt and recognized by a distinct period of rest (endo-dormancy) which extends from late till early spring. Regrowth and flowering in the next season require overcoming such dormancy (Westwood, 1993). Fluctuation of climate affects the regrowth of plum after winter dormancy (Laure and Johnson, 1992).

Hydrogen Cyanamide (HC) is used alone or in combination with mineral oil as a rest breaking agent with many deciduous species and protect from the fluctuation of chilling and heat hours on plum (Shahin et al., 1997 and Aly et al., 1998), (Plamina et al., 1995) on peach; apricot (Shakweer, 2004, Fathi et al., 2008 and Kelany et al., 2009), apple (Sagredo et al., 2005) and pear (Maged et al., 2019). Also, Mohamed and Mohamed (2017) prayed

Dormex at 1 % + 1.5 Caple 2 oil at 15th Feb. on Hollywood and Beauty plum cvs. and get higher fruit set, yield and fruit quality.

The aim of the present study is to asses the appropriate date and dose of spraying Dormex as a breaking agent + Caple 2 as a summer oil to overcome endo-dormancy of Hollywood, Pionear and Aspani plum cultivars within the fluctuation of chilling and heat hours at El-Kanater Hort. Res. Station, Egypt. Rusin et al. (2022) cleared that the study examined methods to overcome bud dormancy in Prunus salicina 'Laetitia' plum trees grown under subtropical conditions with insufficient chilling. The authors tested mineral oil, vegetable oil, and copper sulphate as dormancy-breaking agents. Both mineral and vegetable oils significantly increased budburst and improved flowering uniformity compared with the untreated control, while copper sulphate had moderate effects. The findings highlight the potential eco-friendly alternatives vegetable oils to replace conventional

chemicals like hydrogen cyanamide. The study provides useful insights for sustainable plum production under mild winter climates

MATERIALS AND METHODS

This investigation was carried out during 2022/2023 and 2023/2024 seasons respectively at El-Kanater Hort. Res. Station, Egypt, on three Japanese plum cultivars (*Prunus salicina* L.) namely: Hollywood, Pionear and Aspani. The trees were six years old budded on Marianna plum rootstock (*P. cerasifera* L.) and planted at 4 x 4 meter apart (260 trees/fed). The trees were uniform in size, grown on clay soil under flood irrigation system. Normal Horticultural practices were adopted in accordance with the guidance of the Ministry of Agriculture of Egypt.

The selected trees sprayed with different treatments of endo-dormancy breaking agent Hydrogen Cyanamide (HC, H₂CN₂) in the form of dormex (Degussa/SKW, Germany at 50 %) at three concentration i.e., 0.5 or 1.0 or 1.5 + 3 % Caple 2 (summer oil) at 23rd Jan. or 1st Feb or 15th Feb. through the two seasons of study as Bailey et al., (1982) when the trees exposed to appropriate chilling hours (**Table 1**) from 1st Oct. till spraying date as determined by Central Lab. for Agric. Climate, while

control trees were sprayed with tap water.

Table (1). Chilling hours at El-Kanater Hort. Res. Station as Central Lab. of Agric. Climate.

Correction data -	2022/202	23 season	2023/2024 season			
Spraying date –	≤ 7.2 °C	≤ 10.0 °C	≤ 7.2 °C	≤ 10.0 °C		
23 rd Jan.	10	158	27.5	159.5		
1 st Feb.	16	210	40	209		
15 th Feb.	109	393	74	326		

Three trees were used for each treatment, one tree acts as a replicate totaling ninety trees as well as six limbs around each tree were tagged to assess the following parameters:-

- 1) Index of flowering bud activity every week. Flower buds development stages: dormant, swelling, green tip, balloon, full bloom and fruit set. These stages were used to limit the start and end of flowering bud activity as days from bud swelling till fruit set to estimate the earliness of the studied treatments as Aly et al. (1998).
- 2) Fruit set percentage was calculated as the equation: % fruit set = No. of fruitlets x 100/No. of opened flowers as Williams (1970).
- 3) Fruit development was calculated as days from fruit set till harvest time as Zayan et al. (2016). The duration of flowering and fruit development was limited to calculate the earliness of the treatments than control (A.O.A.C., 2012).
- 4) Picking date is used to estimate crop monetary value considering the farm-gate price of LE 8 or 15/kg when Hollywood fruits were picked through May as well as LE 5 or 10 /kg when Pionear and Aspani were picked at June-Aug. of the two seasons of study. Crop monetary value =

fruit yield / tree x fruits farm – gate price (Zayan et al., 2016).

- 5) The yield fitness was assessed as the equation: yield fitness = fruit yield per tree / planting space (cm²).
- 6) Characteristics of fruit quality: No. of fruits per tree was used to estimate fruit yield (kg/tree), fruit weight (g.), size (cm³) and firmness (lb/inch²) as (A.O.A.C., 2012). Also, fresh fruit juice was used to assess T.S.S. (%), titratable acidity (%) and their ratio.
- 7) Economical evaluation: the cost of chemicals. labor and constant cost irrigation, (electricity for fertilizers. pesticides and pruning) was estimated to calculate the net income of the studied treatments with consideration of the farmgate price (LE 8000 or 15000 per ton of Hollywood cv. and LE 5000 or 10000 per ton of Pionear and Aspani cvs.) through 2023 and 2024 seasons, respectively to assess the profitability of the present treatments (Wiliams, 1970 and Hudson and Gregoriou, 2010).
- 8) Statistical analysis: The present study was designed in a split-split plot system with 3 factors: plum cvs. in the main plot, date of spraying in sub-plot and the dose of

spraying in sub-sub-plot. The treatments were arranged as a Randomized Complete Blocks and the collected data were statistically analyzed (except economical evaluation) according to Snedecor and

Cochran (1995). Means of treatments were compared using the LSD test at 5 % level of probability; differences among means were significantly distinguished by using letters according to Duncan, (1955).

RESULTS

- 1) Fruit set percentage: Table (2) revealed that, Aspani plum cv. has the highest fruit set percentages (17.08 and 17.33%) through the two seasons of study followed by Pionear and Hollywood cvs. Besides, 1.0 % Dormex was more effective on fruit set (16.51 and 18.02 %) than 1.5 or 0.5%. Also, the present results clear that, the 3 studied plum cvs. have more fruit set percentages when sprayed at 15th Feb. (18.7 and 19.27%) than both 2nd and 1st spray or control (7.56 and 8.33 %). The interaction between treatments fixed that, 1.01 % dose was more effective with Aspani cv. than the other 2 cvs. Meanwhile, the studied plum cvs, get higher fruit set with 1.0 % dose at 15th Feb. (the 3rd date). The differences were mostly significant.
- 2) Fruit yield (kg/tree): The present data (Table 2) cleared that, Pionear plum cultivar get higher fruit yield (39.28 and 52.74 kg/tree) through 2023 and 2024 seasons respectively. However, Hollywood cv. get higher yield than Aspani in the 1st season while, the reverse in the 2nd one. The increase of fruit yield through the 2nd season with Pionear and Aspani may be reflecting the good effect of the present treatments.

Spraying date at 15th Feb. (the 3rd spray) resulted in the highest yield through the two seasons of study (37.89 and 42.68 kg/tree) followed by at 1st Feb. then 23rd Jan., respectively. Spraying dose of 1.5 % Dormex get higher fruit yield (34.16 and 35.42 kg/tree) in 2023 and 2024 seasons, respectively. The interaction between plum cvs. and spraying dose showed that, Pionear cv. get higher yield with 1.5 and 1.0 %. Moreover, 1.5 % dose induced higher yield with 3rd spraying date (15th Feb.) especially with Pionear plum cv.

3) Yield monetary value (LE/tree): Table(3) proved that, the studied plum cvs.

- through the 2nd season get much more monetary value than the 1st one may be as a result of increasing fruit yield and yield price. Moreover, Pionear cv. get much more monetary value (LE 559.5/tree) than both Hollywood or Aspani. It is also noticeable that, spraying Dormex at 15th Feb. resulted in significant increase: in monetary value of plum fruits (LE 111.8 and 479.0/tree) followed by at 1st Feb. then at 23rd Jan., respectively while control trees get the least value through the two seasons of study (LE 44.8 and 212.9/tree). Besides, increasing Dormex spraying dose from 0.5 to 1.0 to 1.5 % gradually increased the monetary value of plum fruits especially in the 2nd season. With regard to the interaction, the 3 plum cvs. get higher monetary value with Dormex spray at 15th Feb. (LE 11.78 and 478.94/tree).
- 4) Yield fitness (kg/m²): Yield fitness means the fruit yield of a tree per the distance that it occupies, which reflect the efficiency of yield. However, data in Table (3) showed that, Pionear plum cv. has higher fitness (2.46 and 3.30 kg/m²) than both of Hollywood (2.21 and 1.16 kg/m²) or Aspani (1.35 and 1.40 kg/m²) in 2023 and 2024 seasons respectively. Moreover, Dormex spray at 15th Feb. get higher yield fitness (2.37 and 2.67 kg/m²) followed by at 1st Feb. $(2.18 \text{ and } 2.03 \text{ kg/m}^2)$ and at 23^{rd} Jan. (1.84)and 1.87 kg/m²) while control trees get the least significant fitness (1.64 and 1.24 kg/m²). Meanwhile, spraying Hydrogen. Cyanamide (H₂CN₂) at 1.5 %, significantly enhanced yield fitness (2.13 and 2.21 kg/m²) descended with at 1.0 % (2.02 and 1.92 kg/m²) during the two seasons of study, respectively. So, the highest yield fitness get from the interaction (3.43 and 4.60 kg/m²) when Pionear cvs. sprayed with 1.5 % Dormex +3 % summer oil at 15th Feb. where

plum trees exposed to 109 or 74 hours \leq 7.2 °C as well as 393 or 326 hours \leq 10 °C as Central Lab. for Agric. Climate (**Table 1**).

5) Flowering and maturity duration:-

A) Flowering duration:-

Hollywood plum cv. (Table 4 and Fig. 1) began to flower at (22/2-12/3) and fruit set (15/3-15/4) more earlier than both Pionear and Aspani through the 1st season and flowered at 18/2-19/3 and fruit set at 16/3-25/4 in the 2nd season which was earlier than the 1st one may be to has much more chilling requirements (Table, Pionear cv. began to flower at 3/3-20/3 and fruit set at 28/3-10/5 in 2023 season as well as flowered at 1/3-30/3 and fruit set at 1/4-1/5 in 2024 one. Also, Aspani cv. began to flower at 18/3-10/4 and fruit set at 1/5-25/5 in the 1st season and at 21/3-15/4 and fruit set at 5/5-28/5 in the 2nd one (Table 4 and Fig. 1). So we can notice good interference of the flowering duration of both Hollywood and Pionear cvs, as well as between Pionear and Aspani through the two seasons of study. Besides, this interference allows good cross pollination among the three plum cvs. subsequently have appropriate Dormex spray date also affected the start and duration of flowering where spraying at 23rd Jan. (1st spray) get earlier flowers, duration and fruit set than 2nd or 3rd spraying dates with the present 3 plum cvs. In addition to, control trees began to flower late about 20 days with Hollywood, 17 days with Pionear and 22 days with Aspani. That proved that, Dormex spray was effective to flowering beginning, duration and fruit set. Also, 1.5 % spraying dose was more effective than both 0.5 % and 1.0 through 2023 and 2024 seasons respectively.

B) Fruit maturity-:

Hollywood plum cultivar has gathered at 18/5-27/5 in the 1st season and at 1/5-20/5 in the 2nd one, while Pionear cv. was harvested at 1/6-25/6 in the 1st season and at 5/6-15/6 in the 2nd one. Also, the picking date of Aspani fruits was at 1/8-15/8 in 2023 season while was at 25/7-10/8 in 2024, respectively (**Table 4 and Fig. 1**). So, Hollywood gets much income (LE 8000-15000/ton) than both Pionear and Aspani

- (LE 5000-10000/ton). Dormex spray affected harvest date to begin earlier as well as shortened the duration of harvest. The present treatments obtained 1-10 days earlier of picking date than control with Hollywood cv. and 2-7 days with Pionear and 2-12 days with Aspani through 2023 and 2024 seasons, respectively. Moreover, 1.5% Dormex spraying dose was more effective than both 0.5 and 1.0% dose.
- 6) Number of fruits per tree: The present data (Table 5) explained that, Hollywood plum cv. obtained much more fruits in 2023 season (1512.3) than Pionear or Aspani, while Pionear get significant much more fruits (1310.4) than the other two cvs, in 2024 season. Furthermore, the 3rd spraying date resulted in much more fruits (1264.6 and 1033.7) followed by 2nd one (1243.7 and 813.0) then the 1st date (1031.5 and 762.7) throughout the 2 studied seasons. respectively. Much more fruits were obviously noticed after 1.5 % spraying, dose (1221.0 and 882.0) followed by 1.0 % dose (1169.9 and 780.4) and 0.5 % dose (1059.9. and 712.6), respectively. Greater fruits picked up from the interaction were the 3rd spraying date with 1.5 % dose in Hollywood cv. through 1st season but in the 2nd season Pionear get much more fruits at 1st spraying date with 1.5 % dose. The differences between the means were mostly significant.
- 7) Fruit firmness (lb/inch²):- Table (5) proved that, fruits firmness of Pionear cv. in the 1st season have more firmness (9.30 lb/inch2) than Aspani (9.1) or Hollywood (7.59 lb/inch²) while through the 2nd season of study Hollywood confirm higher firmness (10.07 lb/inch²) than the other 2 cvs. However, the three spraying dates involved with appropriate firmness than control. Moreover, 1.0 % and 1.5 %, strengthened firmer fruits than 0.5 % dose. It is obvious that, control fruits of Aspani involved with much firmer fruits with the three spraying doses in the 1st season while the 3rd spraying date of Hollywood get firmer fruits with the 3 doses in the interaction with significant differences.
- 8) Fruit weight (g.) and size (cm³): Table (6) illustrated that, Aspani has heavier

weight (36.91 g) and size (34.40 cm^3) in the 1st season followed by Pionear (29.22 g) and (28.86 cm³) then Hollywood (23.61 g and 23.86 cm³). While, through 2nd season Pionear has higher fruit weight (39.4 g) and size (36.98 cm³) than both other cvs. Concerned with spraying date, the 3rd date (15th Feb.) resulted in heavier and bigger fruits (40.94 g. and 37.93 cm³) followed by 2nd then 1st dates. Furthermore, 1.5 % doses get heavier and larger fruits than 0.5 or 1.0 %. The interaction effect cleared that, higher fruit weight was obtained with Pionear at 3rd date and 1.5 % dose (42.8 g.), while Hollywood resulted more sized fruits at 3rd date and 1.5 % dose (39.5 cm³).

9) Juice TSS (%): Data in Table (7) proved that, fruits of Hollywood induced higher T.S.S. during 2023 and 2024 seasons (13.13 and 10.36 %) than Pionear (12.96 and 10.18 %) as well as Aspani (10.55 and 9.86 %), respectively. Concern spraying date, 15th Feb. confirms higher T.S.S. through the two studied seasons (13.34 and 10.96 %) followed by 1st Feb. then 23rd Jan. Moreover, in 2023 season 0.5 % dose resulted in higher T.S.S. (12.53 %) while the reverse was in 2024 season (9.99 %). Meanwhile, the interaction explain that, Hollywood with 3rd spray date with 1.5 % dose get higher T.S.S. (15.17 and 12.17 %).

10) Juice acidity (%): The present data (Table 7) explained that, fruit juice of Hollywood has the least acidity through the two seasons of study (0.585 and 0.551%) than Pionear (0.705 and 0.567 %) or Aspani (0.793 and 0.714%), respectively. Also, 2nd spray date in 2023 (0.612%) while 3rd spray date in 2024 get lower acidity (0.560 %). Furthermore, 0.5 dose in the 1st season (0.654 %) while 1.5 dose in the 2nd season (0.591 %) have less acidity percentage. The interaction of the 1st date at 0.5 % dose affected Hollywood juice to be less acidity (0.503 %) through the 1st season while 3rd date at 1.5 % dose has lower interaction (0.457 %) in the 2nd season. Thus, higher

T.S.S. with less acidity means better taste (Westwood, 1993). In reverse, juice acidity was higher with Aspani and control treatments.

11) T.S.S. per acidity ratio: The ratios of T.S.S. per acidity (Table 7) confirm the interaction between T.S.S. and acidity. However, the present results strengthened the notice that Hollywood cv. has higher ratio (22.89 and 19.19) than Pionear (18.63 and 18.15) or Aspani (14.97 and 13.94) through the two studied seasons respectively. Besides, 3rd spraying date (15th Feb.) get obvious increase in this ratio (20.5 and 20.6) than the other 2 dates, while control treatment fixed the least ratio (14.0 and 13.4). Also, 0.5 % dose involved with higher ratio (19.86) in the 1st season while 1.5 % dose obtained higher ratio (18.21) in the 2nd season, respectively. As for the interaction effect, 2nd and 3rd spraying dates at 0.5 % Dormex dose induced juice of Hollywood fruits to has higher ratio (26.92 and 27.08) in 2023 season, while 3rd date at 1.5 % dose get higher ratio (26.64) in 2024 season. So we can use this ratio as an indicator to higher T.S.S. and lower acidity. The differences between the means were mostly significant. 12) Economical evaluation: Data in Table

(8) revealed that, Hollywood plum cv. achieved higher income in 2023 season may be as a result of higher fruit yield (9.55 ton/Fed.) and higher farm-gate price (LE 8000/ton) compared to the other 2 cvs. In reverse, through 2nd season Pionear fixed much more income (LE 116640) than both Hollywood and Aspani may be as a reflection of higher fruit yield (15.25 ton/fed.). Furthermore, Dormex spray at 15th Feb. in both seasons of study has higher net income (LE 25785 and 103387.5) higher in reverse to at 23rd Jan. or at 1st Feb. or even control. However, 0.5 % dose resulted in higher net income (LE 27500) through 2023 season but 1.5 % dose caused better net income (LE 90850) through 2024 season.

DISCUSSION

The present results fixed that, Hollywood, Pionear and Aspani plum cultivars, positively responded to the studied endo-dormancy breaking agent (H₂CN₂) with 0.5, 1.0 and 1.5% + 3%, summer oil (Caple 2) at 23^{rd} Jan.. 1st Feb. and 15th Feb. when the trees have sufficient chilling requirements (Table 1). Hence, the studied treatments effectively accelerated dates of flowering, fruit set and picking date. Meanwhile, the present treatments increased fruit set percentage, fruit yield (kg/tree and ton/Fed.), monetary value (LE/tree), yield fitness (kg/m²), number of fruits/tree, fruit firmness (lb/inch²), fruit weight (g.) and size (cm²), T.S.S.(%), T.S.S./acidity ratio as well as the grower net income (LE) while decreased acidity (%) than control.

Furthermore, many investigators used dormancy breaking agents, since Hydrogen Cyanamid began to be used commercially to complete and synchronize bud breaking in (Larue and Johnson, 1992 and Plamina et al., 1995). Increase bud burst to highest percentages, uniform bud breaking to concentrate flowering and harvest. Hasten bud break of a cultivar to achieve improved cross pollination. HC is used in Latin America on: apple, cherry, plum, fig, pear, peach and kaki. Local researches have come up with specific recommendations regarding dosage and time of application (Behnke, 1992). Some regions do not provide adequate chilling for growing plum trees and apple necessitating using artificial means to break dormancy (HC) alone or in combination with mineral oil (Mansour et al., 1999, Sagredo et al., 2005, Mahrous and El-Fakharani 2006, Hudson and Gregoriou, 2010 and Maged et al., 2019). However, these factors vary with variety and climatic zone. Also, Shakweer (2004) sprayed HC + mineral oil which increased "Canino" apricot flower buds opening, advanced flowering, fruit set and fruit yield; as well as Fathi et al., (2008) concluded that, the best treatment at 3 % Dormex + 3 % Capl 2 oil which sprayed at 9th Feb. To attained early production and higher yield with good fruit quality and increased the grower income.

Meanwhile, 1.5 %, dose of HC + 3 %, Capl 2 sprayed at 15th Feb. after 74-109 °C < 7.2 °C (Table 1) get the best results in the present study. Also, Ramina et al., (1995) showed that, t-zealin riboside which remained low through the rest period, increased at bud swelling of peach which corresponded positively with the increase in chilling units. Besides, Aly et al., (1998); Mohemed and Mohmed (2017) sprayed Dormix at 1.0 % + 1.5 % Capl 2 oil at 15th Feb. on Hollywood and Beauty plum cultivars under fluctuations of chilling and heat hours and get higher fruit set percentage and yield as well as earlier fruit set (17-21 days) than control and no agent residues were found in fruits after 110 days of application.

الملخص العربي تأثير التذبذب في درجات الحرارة على نمو وإثمار ومحصول بعض أصناف البرقوق تحت ظروف محافظة القلبوبية

مصطفى احمد فتحي؛ يحي إبراهيم النجار؛ نيفين مصطفى طه و درويش رجب درويش قسم بحوث الفاكهة المتساقطة الأوراق، معهد بحوث البساتين، مركز البحوث الزراعية، الجيزة، مصر

تم إجراء هذه الدراسة على 3 أصناف من البرقوق الياباني ؛ هوليوود بيونير واسباني مطعومين على أصل البرقوق الماريانا. الأشجار كانت بعمر 6 سنوات منزرعة على مسافات 4×4 متر (260 شجرة بالفدان) تحت نظام الري بالغمر في محطة بحوث البساتين بالقناطر الخيرية، مصر. تم رش الأشجار أيام 23 يناير، الأول من فبراير، 15 فبراير خلال عامي 2023/2022 وذلك بتركيزات 0.5 ، 1.0 و 1.5 % دور مكس (سيناميد الهيدروجين) + 3 % زيت كابل (زيت صيفي) وقد صممت التجربة في قطاعات كاملة العشوائية (تجربة عاملية).

أوضحت النتائج أن صنف الهو أيوود كان مبكراً في التزهير (18-22 فبراير) والعقد (15-16 مارس) وجمع المحصول (18-13 مايو) مع أقصر فترة تزهير (23-36 يوم) ونمو للثمار (35-63 يوم). ثمار صنف الهوليوود كانت أعلى في نسب السكريات الكلية الذائبة (TSS) ونسبة السكريات الكلية / الحموضة (TSS/acid ratio) مع أقل نسبة حموضة، وأعطت أكبر عدد من الثمار على الشجرة مع صلابة عالية وعائد نقدى أعلى من الصنفين الآخريين خلال الموسم الأول من الدراسة.

أعطى صنف بيونير أكبر محصول وأعلى كفاءة للمحصول (كمية المحصول ÷ المساحة التي تشغلها الشجرة) كما كان تزهير صنف بيونير متداخل مع فترة التزهير لكل من صنفي هوليوود والاسباني مما يساعد على ضمان التلقيح الخلطي بين الأصناف الثلاثة. كما أعطى عدد أكبر من الثمار على الشجرة وصلابة ووزن وحجم للثمار وقيمة نقدية للثمار، كما أعطى أعلى عائد نقدي للمحصول خلال الموسم الثاني للتجربة.

تميز الصنف الاسباني بأنه أعطى أعلى نسبة لعقد الثمار مع وزن وحجم أكبر للثمار، هكذا نستطيع من خلال هذه الدراسة أن نوصي مزارعي البرقوق لتفضيل زراعة صنفي هوليوود وبيونير مع رشهم عند توفر 74-109 ساعة برودة أقل من 7.2 م أو 326-393 ساعة برودة أقل من 10.0 م . يفضل الرش يوم 15 فبراير بـ 1.5 % دورميكس + 3 % زيت كابل 2 حسب التذبذب في درجات الحرارة وذلك للحصول على تزهير مبكر وتلقيح خلطي مناسب يسبب نسبة عقد أفضل ومحصول أعلى وبالتالي زيادة دخل المزار عيين.
