Abstract

A series of Cr(III), Co(II), Cu(II) and Zn(II) complexes of two types (ML,ML) Where L is 2, 5, 6, 7 – tetrahydro – 2 –thioxo – 1H- cyclopenta[b] pyridine- 3-carbonitrile are synthesized and confirmed by their elemental microanalysis, IR, electronic absorption spectra, magnetic moment and HNMR spectra. The various decomposition steps are determined from thermal analysis and determined the numbers of water molecules in the complexes. Kinetic parameters of the thermal decomposition have been evaluated and the data was refined using the least square method. Values of the activation energy, correlation coefficient and order of decomposition reaction were computed and discussed. Also Entropy (Δ S), enthalpy (Δ H) and free energy (Δ G) of activation were computed. And biological effects were studied.

Introduction

Although many aspects of donor behavior of sulfur-containing ligands have been investigated [1-4], yet for heterocyclic systems attention has been mainly concentrated on nitrogen-containing ligand molecules [5,6]. Heterocyclic thiones are a group of ligands containing thioketonic (thiones) group directly attached to the carbon atoms of the heterocyclic molecules and thus, thione ligands possess donor behavior of both sulfur- containing systems as well as heterocyclic molecules. A common feature of all nitrogen-containing heterocyclic thiones is the thiol \leftrightarrow thione tautomerism (schems 1) where it has been established [7,8] that the thione dominates in the solid state.

Schems 1

Experimental

I- Materials

Metal salts: The metal salts CrCl₃.6H₂O, CoSO₄.7H₂O, CuSO₄.5H₂O and ZnSO₄.7H₂O used for the preparation of complexes were of general grade reagents (prolabo chemicals).

II-Preparation Of The Ligand [9]:

Ligand (HL¹): 2,5,6,7-tetrahydro-2-thioxo-1H-cyclopenta[b]pyridine-3carbonitri-le. The derived from heterocyclic compounds, which we are used, were prepared according to the literature procedure [9].

The ligand used in the present study has the following structures:

Primary ligands

III-Preparation Of The Binary Complexes:

The binary complexes were synthesized by adding a clear methanolic solution (25 ml) of the metal salt (1 mmole) dropwise to methanolic solution (25 ml) of the ligand (1 and 2 mmole) in 1:1 and 1:2 molar ratios (M : L) with constant stirring in one direction with heating for two hours. The precipitate was obtained then left at room temperature for 12-24 hour. The mixture (methanol) was permitted to evaporate slowly at room temperature until one-third its original volume, whereby a microcrystalline solid was separated. Then the solid obtained was filtered, washed with methanol and dried in vacuo over P_4O_{10} . The binary complexes were analyzed for their carbon, hydrogen, nitrogen, sulfur, and metal contents.

IV-COMPLEX SOLUTIONS:

Stock solution of complexes were prepared by dissolving the accurate weight of each in the appropriate volume solvents (DMF) solutions of required concentration were prepared by accurate. Dilution with the prper solvent.

V - IR spectra:

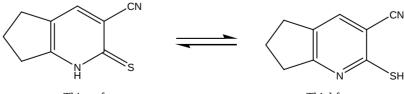

IR spectra of the ligand and its metal complexes were recorded on Shimadzu 140 Infrared Spectrophotometer (4000 - 400 cm) as KBr discs. The proton HNMR spectra DMSO –d6 on a Varian FT -200 Mhz spectrometer using TMS as internal standard at Assiut university. The electronic absorption spectra were recorded with Shimadzu 2101 recording spectrophotometer. All conductance measurements reported in this study were performed using an LF Digi 550 conductance bridge with an immersion cell . The thermogravimetic analysis were detrmined using Shimadzu analyzer 50 H For TGA and DTA in a dynamic nitrogen atmosphere (100 ml/min). The antimicrobile activity of the ligand and their complexes was tested using the usual cup – plate diffusion technique. The culture media used are nutrient agar media supplemented with 1 g yeast/L.

Results And Discussion

I.1 The results of elemental analyses are show in Table 1. The complexes are soluble in DMF and DMSO, but not soluble in most common organic solvents. The measured molar conductance values of dimethylformamide (DMF) solutions of Cr(III), Co(II), Cu(II) and Zn(II) complexes fall in the range 25.37-57.23 Ohm⁻¹ Cm² mol⁻¹ (Tables 1). These values indicate that those complexes are non electrolytes, since the reasonable range for 1:1 electrolytes in DMF is 65-90 Ohm⁻¹ cm² mol⁻¹ [10]. On the other hand molar conductance values of Cr(III) complex (1:1) (metal : ligand) is 77.92 Ohm⁻¹ Cm² mol⁻¹ indicate that this complex is 1:1 electrolyte [10].

1.2. IR SPECTRA

Infrared spectra of crystalline solid compounds have been investigated. The IR spectra of the free ligands 2,5,6,7-tetrahydro-2-thioxo 1*H*-cyclopenta[b]pyrindi-ne-3-carbonitrile (HL¹) exhibit thione-thiol (HN-C=S \leftrightarrow N=C-SH) tautomerism [11] as given in scheme **2**.

11 0

The IR spectra of the free ligands 2,5,6,7-tetrahydro-2-thioxo 1*H*-cyclopenta[b]pyrindi-ne-3-carbonitrile (HL¹) show the absorption band in the range 3600 - 3300 cm⁻¹, can be assigned to stretching vibration of (NH) group [12]. The appearance an absorption band at 2950 cm⁻¹ in HL¹ attributed to **v** aliphatic structure of cyclic. Also The presence of an absorption band at 2185 cm⁻¹ attributed to stretching vibration of $v C \equiv N$. The presence of an absorption band at 1240 cm⁻¹ attributed to stretching vibration of $v C \equiv S$.

The IR spectra of investigated solid complexes shows disappearance the bands in the range 3500 - 3300 cm⁻¹ due to stretching vibration of (NH) group in ligand . The disappearance of these band is due to the displacement of the hydrogen ion from the NH group [11,13,14] through the coordination moiety. This result confirmed by ¹H NMR data.

The band at 2185 cm⁻¹ in HL^1 is att1ributed to stretching C=N are shifted to lower frequencies due to coordination in all investigated complexes, in the range 2220-2200 cm⁻¹ for HL^1 complexes.

The band at 1280 cm⁻¹ in HL¹ which corresponding to stretching vibration of C=S are shifted tor lower frequencies due to coordination with metal ions [15] in the range 1150-1260 cm⁻¹ for all complexes.

The appearance of a broad band in range $3450 - 3650 \text{ cm}^{-1}$ is due to νOH of coordinated water complexes [14-16].

Also the two new bands appear for all chelates at 500-540 cm⁻¹ region corresponding to stretching [M-S] [16-17] metal-sulphur bond or M –O bond [17] and at 430-470 cm⁻¹ due to stretching [M \leftarrow N] [16] metal-nitrogen bond. The important IR bands are listed in (Tables 2) and (Figs 1,2)

1.3. ¹H NMR

The ¹H NMR spectrum of the ligand [9] HL¹ show characteristic signal at 2.2 ppm due to appearing the (–NH) proton and Moreover the appearance of the band located at 2.8 ppm may be assigned to the (–SH) proton. The band observed at 7.95 ppm may be assigned to (–CH–pyridine–) proton. The important ¹H NMR spectrum bands are listed in (Table 3) for ligand HL¹ and its complexes.

Table 3: ¹H NMR spectrum data of ligand (HL¹) and its metal complexes (ppm).

1.4. Electronic Spectra And Magnetic Susceptibility Measurements.

The obtained spectral characteristic data (mainly υ_{max} in cm⁻¹ and ε_{max} in cm² mol⁻¹) of the different band displayed by the free ligand and their binary complexes are given in (Tables 4, 5) and (Fig. 3-8)

Cr(III) COMPLEXES

The electronic spectra of the Cr(III) complexes exhibits tow sets of bands. The first set of bands with v_{max} at 30.581 cm⁻¹ and 29.940 cm⁻¹ could be attributed to intra-ligand charge transfer transitions in N_----C_---S moiety [18]. The second set having v_{max} at 21.598 Cm⁻¹ and 21.141 cm⁻¹ attributed to the d-d electronic transition which may be assigned ${}^{4}A_{2g}(F) \rightarrow {}^{4}T_{2g}(F)$ transition. Octahedral geometry is proposed [19-21].

At room temperature magnetic moment value of the complexes $[CrCl(L^1) (H_2O)_3]$ ·Cl⁻5H₂O and $[CrCl(L^1)_2(H_2O)]$ ·7H₂O are 3.82 and 3.97 B.M. respectively, indicating the presence of three unpaired electrons [21-24].

Co(II) COMPLEXES

The electronic spectrum of Co(III) complexes exhibits tow sets of bands. The first set of bands with v_{max} at 30.674 and 30.120 cm⁻¹, could be attributed to intraligand charge transfer transitions. The second set include a shoulder bands having v_{max} at 21.413 and 21.739 Cm⁻¹ for [Co((L¹)(H₂O)₂] and [Co(L¹)₂(H₂O)₂] respectively attributed to the d-d electronic transition which may be attributed to (⁴T_{1g} \rightarrow ⁴T_{1g}) (P), suggesting octahedral geometries [25-26].

At room temperature magnetic moment value of the complexes $[Co(SO_4)_{0.5}(L^1)(H_2O)_2]$ is 3.74 indicating the presence of three unpaired electrons. And $[Co(L^1)_2(H_2O)_2]$ is 6.95 B.M., characteristic of high-spin octahedral [21,27,28] Co(II) complexes.

Cu(II) COMPLEXES

The electronic spectra of complex $[Cu(SO_4)_{0.5}(L^1)]$ display two sets of bands. The first set of band at v_{max} 30.120 cm⁻¹ could be attributed to intra-ligand charge transfer transitions. The second set having v_{max} at band 21.881 cm⁻¹ attributed to the

d-d electronic transition which attributed to ${}^{2}B_{1g} \rightarrow {}^{2}A_{1g}$ transition, suggesting square planer geometries [29,30].

At room temperature magnetic moment value of the complex $[Cu(SO_4) (L^1)]$ is diamagnetic.

Zn(II) COMPLEXES

The electronic spectrum of Zn(II) complex exhibits two sets of bands. The first set of bands with v_{max} at 33.670 cm⁻¹ and 34.602cm⁻¹ could be attributed to intraligand charge transfer transitions. The second set includes a shoulder bands having v_{max} at 24.509 cm⁻¹ and 26.178 cm⁻¹ attributed to the L \rightarrow MCT transition.

Zn(II) complex are found to be diamagnetic as expected for d¹⁰ configuration. On the basis of elemental analysis, infrared spectra, magnetic measured, thermal analysis and known coordination preferences, tetrahedral geometry [31,32] is suggested for [Zn(SO₄) (L¹)]³H₂O, while octahedral structure [33,34] is suggested for [Zn(L¹)₂(H₂O)₂]²H₂O.

1.5. Tentative Structures

Based on the above results gained from elemental analysis, IR, ¹HNMR and electronic spectra, the following tentative structures show the coordination sites of the ligands in the complexes (1-8) [11].

1.6. THERMAL STUDIES [35,36]

The complex of $[CrCl_2(L^1)(H_2O)_2]^6H_2O$, show the decomposition in three steps in the temperature range 40-267, 226-360 and 362-607°C. The first step corresponds to the evolution of 8 crystalline and coordinate water molecules, the second step corresponds to decomposition C_8H_7N with amount 26.47%. The third step amounted to 16.18%, attributed to the removal of 2Cl, while the final product is CrS and CN with amount 25%.

For the complex $[CrCl(L^1)_2(H_2O)].7H_2O$, the pyrolysis curves exhibit almost, the same TGA pattern, namely three decomposition steps in the range 40-120°C, 200-107°C and 350-700. The first step corresponds to the evolution of 8 crystalline and coordinate water molecules, the second step corresponds to decomposition $2C_8H_7N$ with amount 40.29%. The third step amounted to 14.93%, attributed to the removal of Cl and 2CN, while the final product is CrS_2 with amount 20.15%.

While the complex $[Co(SO_4) (L^1)(H_2O)_2]$ decompose in two step, the first step in the range 200-333°C which corresponds to the evolution of 2 coordinate water molecules. The second step corresponds decomposition C₅HN & (SO4), CN and S with amount 56.82%, while the final product is Co with amount 18.38%.

For the complex $[Co (L^1)_2(H_2O)_2]$ show the decomposition in two steps in the temperature range 226-333 and 400-616°C. The first step corresponds to the evolution of two coordinate water molecules, the second step corresponds to decomposition C₈H₇NS, CN and S with amount 45.76%, while the final product is CoS with amount 20.34%.

While the complex [Cu(SO₄) (L¹)] decompose in three steps, the first step in the range 200-320°C which corresponds to the decomposition C_3H_6 . The second step in the range 358-483°C corresponds decomposition C_5HN and CN with amount 35.07%, and the third step in the range 665-780°C corresponds decomposition (SO₄) with amount 16.42%, while the final product is CuS with amount 33.58%.

SYNTHESIS, CHARACTERIZATION AND THERMAL STUDIES ... 119

For the complex $[Cu (L^1)_2]$ 7H₂O show the decomposes in three steps in the temperature range 40-110, 200-341 and 645-729°C. The first step corresponds to the evolution of 7 crystalline water molecules, the second step corresponds to decomposition 2C₈H₇N with amount 43.19%, and the third step corresponds to decomposition 2CN with amount 9.85%, while the final product is CuS₂ with amount 23.48%.

While the complex $[Zn(So_4) (L^1)]$ ·3H₂O decompose in three steps, the first step in the range 40-131°C which corresponds to the evolution of 3 crystalline water molecules. The second step in the range 223-360°C corresponds decomposition C_8H_7N with amount 34.33%, and the third step in the range 400-650°C corresponds decomposition CN, (SO₄) and S with amount 30.60%, while the final product is Zn with amount 19.40%.

For the complex $[Zn(L^1)_2(H_2O)_2]^2H_2O$ show decomposes in two steps in the temperature range 232-322 and 330-697°C. The first step corresponds to the evolution of 4 crystalline and coordinate water molecule, the second step corresponds to decomposition $2C_8H_7N$, 2CN and 2S with amount 71.64%, while the final product is Zn with amounts 13.61%.

The TGA and DTA data are presented in (Table 6) and (Figs. 9-11).

Kinetic data of the complexes

The coats-redfern and Horowitz-Metzger equations were used for evaluating the kinetic parameters [37,38]. (Table 7) reports the computed values of activation energy for the various decomposition steps which are given in (Table 6).

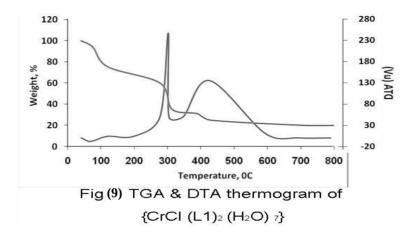

Entropy (Δ S), enthalpy (Δ H) and free energy (Δ G) of activation [39-46] were computed using equations (1), (2), (3).

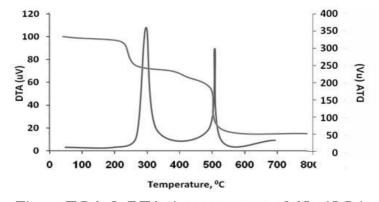

$\Delta S = 2.303 (\log zh/kT_s) R$	(1)
$\Delta H = E-RT_s$	(2)
$\Delta G = \Delta H - T_s \Delta S$	(3)

Where k and h are Boltzman and Plank constants, respectively. The data are compiled in (Table 8)

1.7. MICROBIOLOGICAL SCREENING

Tests were directed towards bacteria. The tested bacteria species some of them are pathogenic, namely *Staphylococcus aureus* (Gram +ve) *Eicoli* and *Klebsilla*. These species were cultivated on nutrient agar (N.A) media. The synthesized compounds were dissolved in DMF. Sterilized filter paper discs were added to dissolve compounds until saturation. Then the saturated discs put on the surface of agar plates. The plates were incubated at 28 °C for 24 hours. The inhibition zones around the discs were measured in mm. (Table 9) indicates the antmicrobiological activity of each compound.

	Bacteria						
Complexes	Staphylococcus	Eicoli	Klebsilla
